

PITCH DECK · 2026

Smart Parking

AI that sees every parking space.

Real-time computer vision on existing city cameras — live availability, instant booking, zero new hardware.

Computer Vision · YOLOv8

Almaty, Kazakhstan

Pre-seed · \$500K

THE PROBLEM

Parking is broken in every big city

600K+ vehicles in Almaty · 1M+ on the roads daily
602 : 264 cars per parking space in surveyed areas
20–30 min average time wasted searching for a spot

Drivers

Circle blocks daily, burn fuel and time, arrive late and stressed. No way to know where a spot actually is.

Operators

Run parking blind: 40–60% vacancy off-peak, no occupancy analytics, no dynamic pricing, no digital channel.

THE SOLUTION

Turn existing cameras into a real-time parking brain

See

Computer vision (YOLOv8) detects every car and every free/occupied space from **CCTV cameras that already exist**. No sensors, no construction.

Python · YOLOv8 · edge computing

Book

Drivers get a live map of available spots and instant guaranteed booking — no circling, no guessing.

Next.js web · PWA

Optimize

Operators get occupancy analytics, demand heatmaps and dynamic pricing — fill empty capacity, grow revenue.

Dashboard · API · integrations

Already built, not a slideware dream

- ▶ **CV engine** — YOLOv8 pipeline detecting cars & occupied spots from live camera feeds
- ▶ **Web platform** — Next.js booking interface with live availability map
- ▶ **Operator dashboard** — occupancy monitoring & analytics
- ▶ **PWA client** — installable driver app, works offline-first

>90% target detection accuracy

0 new sensors required — existing CCTV only

GitHub public prototype repo

Deep-tech under the hood

- ▶ **YOLOv8** object detection trained on PKLot / CNRPark+ datasets
- ▶ **Edge inference** (NVIDIA Jetson) — low latency, video never leaves the site = privacy by design
- ▶ **Cloud API** aggregates thousands of cameras into one city-wide availability layer
- ▶ Path to **predictive availability** (demand forecasting) in v2

Why now

Camera hardware is everywhere and cheap · CV models hit production accuracy · cities digitalize parking enforcement · EV era demands smarter curb management.

Python · YOLOv8 · Jetson · Next.js · PostgreSQL

MARKET

A \$53B market growing 23% a year

\$10.2B global smart parking market, 2025

\$53.4B projected by 2033

23.3% CAGR

Beachhead: Almaty

- ▶ 5,000+ mall parking spaces
- ▶ 3,000+ business-center spaces
- ▶ 10,000+ residential complex spaces
- ▶ Then: Astana, Shymkent → Central Asia

BUSINESS MODEL

SaaS + commission, software margins

B2B SaaS

\$8–20 per space / month

Occupancy analytics + live availability for operators.

Booking fee

10% commission on reservations

Guaranteed-spot bookings through the driver app.

Unit path

\$50K MRR goal at month 12

Camera-per-space cost path to **\$400** at scale, gross margin >50%.

COMPETITION

10× cheaper than sensors, 10× smarter than apps

Player	Model	Gap we exploit
ParkMobile / SpotHero	Reservation app, marketplace	No real-time availability — "maybe" bookings
Parqour (KZ)	B2B parking infrastructure	Weak consumer UX (2.4★), no CV layer
Sensor vendors (Cleverciti, Bosch)	Hardware per space	\$300–600/space CapEx — we ride existing cameras
Smart Parking	CV SaaS on existing CCTV	Real-time truth + booking + zero hardware CapEx

DISTRIBUTION MOAT: EVERY OPERATOR CAMERA WE TRAIN = SWITCHING COST

08 / 11

From prototype to pilots

✓ Done

- ▶ Working MVP: web platform + YOLOv8 CV pipeline
- ▶ Market & unit-economics validation (6-step study)
- ▶ Team formed via Narxoz AI Startup Incubator

🎯 Next 6 months

- ▶ **Pilot 1:** Narxoz campus parking — live accuracy test
- ▶ **Pilots 2–3:** Almaty mall / business center, LOI → paid pilot
- ▶ **Scale:** 10 operators, 5,000+ monitored spaces

TEAM

Built by shippers, not talkers

Baqdaulet Yernazaruly — Founder / CEO

AI Systems Engineer & Computer Science Lecturer (Narxoz). 4 years turning student teams into production builders.

CV · LLM/RAG · systems engineering · teaching

Track record

23 projects shipped with student teams

4 apps running in production (Daladelish restaurant ecosystem, 24/7)

5-person incubator team: web, AI, GTM, analytics

THE ASK

\$500K pre-seed → every space visible

Use of funds

3 paid pilots in Almaty · CV team of 4 · edge hardware for 10 sites · GTM to 10 operators.

12-month milestones

5,000+ monitored spaces · \$50K MRR · 10 operator contracts · accuracy >90% in production.

Vision

Every parking space in Central Asia visible and bookable in real time. The data layer of the curb.
